Seasonable Notes.

Indications are that a much less acreage has been planted in certain lines of food crops throughout the South than last year. Particularly is this true in regard to potatoes and vegetable crops. The indications are also that a much less crop of potatoes is being planted all over the country this year than last year and this should make for very much better market conditions on potatoes another season than has existed during the present season and it seems to us that potatoes, for late planting, particularly, both for home use and market, should command themselves to our growers everywhere. Potatoes are one of the most important food crops and anything of a scarcity in this line will likely make for high prices another season.

We would also strongly urge our gardeners and market growers to plant liberally of vegetable crops for fall and winter use, as present indications are that nothing like the same attention has been paid to home gardening crops as last year, and market growers generally have not put in anything like the large acreage in vegetable crops as usual, owing partly to labor shortage, and also to the fact that these crops were not very profitable last year. This is likely to make for scarcity another fall and winter, and our farmers and gardeners everywhere should plant as liberally as possible in order to overcome this shortage.

Our Annual Catalog gives full information in regard to Vegetable Seeds, and if any of our customers have not received or have mislaid this, we shall take pleasure in mailing another copy on request.

It is very desirable for our farmers to sow all the forage crops possible, to make hay and feed, so as to save grain for human consumption. The livestock industry is likely to continue very profitable for years to come, and farmers everywhere should endeavor to get their farms in condition to feed and carry all the live-stock possible. Not only is the breeding of live-stock very satisfactory and attractive to farmers everywhere but the live-stock can be handled and fed with a minimum of labor, compared to the production of market crops on the farm.

The sowing of COW PEAS at the last working of corn is to be very strongly recommended. Farmers who have practiced this claim that the sowing of Cow Peas in corn increases the yield of corn, and at the same time it makes a more desirable soil-improving or forage crop, which can be grown with very little extra labor. The high prices of fertilizers emphasize particularly the desirability of sowing soil-improving crops, and Cow Peas and Crimson Clover are unquestionably two of the most valuable crops that can be sown for this purpose. The Cow Peas, of course, are to be particularly recommended at this season of the year. Later in the season, Crimson Clover can be used to better advantage.

I have planted your German Millet and Whippoorwill Cow Peas for three years for hay and made the heaviest hay crop of any seed ever sown.—J. R. BRUBAKER, Page Co., Va., March 4, 1917.

COW PEAS and SOJA BEANS being rather more plentiful than expected, have declined in price, we believe, however, that this decline is only temporary, as stocks are not large, and the supplies, particularly of Cow Peas, in the districts of the Carolinas where these are usually grown quite extensively, are very light. We are receiving a good many orders from farmers in districts which usually grow these peas, showing that the stocks will be nothing like sufficient to fill requirements in those sections. We believe that there will be an unusual demand for these seeds this season particularly on account of the fact that they are among the best summer forage and soil-improving crops that can be used, and the scarcity and high price of fertilizers strongly commends their extended use wherever they can be sown to advantage.

The growing of Cow Peas and Soja Beans not only makes large yields of excellent and most nutritious forage, but even if the crops are used for forage or grazing purposes, the resulting effect on the soil is very great. The action of the roots and stubble make a considerable improvement, both in the condition and productivity of the soil. In recent years it has also become a very frequent custom to sow Cow Peas in Corn at the last working, or to drill them in the middle of the rows between the Corn, and some of our best farmers claim that they make increased yields of Corn in growing Cow Peas in this way, with decidedly increased productivity of the soil.

Where Cow Peas are cut off early for a forage crop, they frequently make a very good after-growth, and can be turned under in time to sow the late wheat or fall grain to advantage. Crops of wheat or fall grain always show a decided improvement following a crop of Cow Peas, and the sowing of Cow Peas is really one of the best of crops to put in first-class condition for fall-sown grain. The increases in yield, in wheat particularly, are very marked, following a Cow Pea crop.

COW PEAS sown mixed with SOJA BEANS also make one of the largest yielding, best and most nutritious of forage crops. The Soja Beans, being upright in growth, help to hold up the Cow Peas, thus making a larger growth, and also enable the Cow Peas to be cut and cured to better advantage. Soja Beans contain more protein and fat-forming elements than Cow Peas, and the feeding value of the crop sown mixed together is considered very superior. The mixture recommended is half a bushel of Soja Beans with one bushel of Cow Peas. Cow Peas and mixed Cow Peas are better for sowing for this crop than the straight variety.

SOW COW PEAS AFTER HARVESTING GRAIN CROPS.

Farmers should make every preparation to sow all the Cow Peas possible after harvesting their grain crops this year, so as to increase the fertility and productivity of their lands for crops to follow.
The sowings of **COW PEAS** and **GERMAN MILLET** for a hay crop has proved very satisfactory with some of our farmers, who have been enabled to sell the product very readily at good prices. Wherever this feed is used, it is very much liked, one of our farmers reporting that after using this feed in his sale in this city, 50 per cent of the orders from his customers until his stock was entirely exhausted, selling his entire crop at good, profitable prices.

The Whippoorwill is one of the best kinds for sowing with **German Millet**, and are recommended usually at the rate of one bushel of peas to half bushel of German Millet per acre. The crop should be cut when the Millet is ready. The peas will have reached the dough stage by that time, and make an excellent combination of large-yielding and most nutritious feed.

**BLACKEYE PEAS** is one of the crops that should be grown very largely everywhere. They are very profitable at anything like present prices and are specially well adapted to growing all through the Middle Atlantic and Southern States. The **Early Ramshorn** is one of the best quality and largest-yielding of the Blackeye Peas.

**PLANT THE EARLY VARIETIES OF SOJA BEANS FOR A PROFITABLE CROP.** The Ita San, Early Wilson and Early Green, can be planted later than other kinds to mature a crop of beans. These sojas in the past have always sold at much higher prices than the regular soja beans and indications are that they will continue to command a high price. The early varieties of sojas, particularly in the North and West has been growing very rapidly in the past two or three years, and indications are that this will continue, as the Northern and Western farmers are just beginning to appreciate the great value of soja beans for summer forage and feed crop.

The growing of **100-DAY VELVET BEANS** is increasing to a wonderful extent all throughout the South. It makes an enormous growth of vine, making a splendid forage and grazing crop and a wonderful soil-improver. It makes a growth of vine and forage so large that it is difficult to harvest and cure the vines for dry fodder, and where this is desired, it is better to sow Cow Peas or Soja Beans, but for late fall and winter grazing and cattle-fattening crop and soil-improving the Velvet Beans are hard to beat.

In the South these beans are very generally grown in with the corn. The corn is planted in rows five feet apart, and the corn about three feet apart in the row, and the beans planted in the drill between the corn. At the last working of the corn, beans are planted again in the middles between the rows of corn. When the corn is dry, it is pulled from the stalk and the cattle afterwards turned in to graze in the Velvet Bean and corn fields. It furnishes most nutritious and fattening food for cattle and is considered the best method of fattening cattle known, and at the same time, the roots and what is left of the vines after the cattle are taken off, when turned under make a good soil improver.

The crop grown in this way not only gives a grain crop, but a splendid fattening cattle crop, and also makes for decided improvement to the land. We strongly recommend to our cattle farmers all throughout the South to practice this method, feeling sure that they will get the most satisfactory and profitable results.

**Velvet Beans planted by themselves are usually planted in rows five feet to five feet apart at the rate of about half bushel per acre.**

**The ENSLAGE CORNS** which we offer are the best and most productive kinds in cultivation, making the largest possible yields of feed for winter use. Farmers everywhere should realize the value of sowing plenty of ensilage corns so as to fill their silos and furnish them with one of the largest yielding and most nutritious cattle foods during the winter.

**BUCKWHEAT** is the quickest-growing of grain crops, and can be put in to excellent advantage as a summer crop. It is usually sown in June or early in July, and makes a large yield of grain, and is considered quite a profitable crop, particularly for our Piedmont and mountain farmers. It also makes very satisfactory crops in the eastern portion of the Atlantic Seaboard. Sow at the rate of one bushel per acre.

**KAFFIR CORN** not only makes a very desirable forage crop, but is also an excellent crop to plant for a crop of grain. It makes one of the best of poultry foods, and one of the best and cheapest grain foods for cattle, provided it is ground before feeding.

**SUGAR DRIP SORGHUM.** Customers who are growing this are enthusiastic in its praise in regard to the large yield of superior quality of syrup which it makes. Aside from the fact that sorghum is one of the most profitable crops that can be grown, it is very desirable, in view of the scarcity of sugar, to increase crops of this character, and every farmer should at least plant a small patch of sorghum so as to provide syrup for home use, while those who can do should grow large acreages with a view of selling the syrup on our markets.

All the **SORGHUMS** make excellent fodder crops and are particularly desirable for feed for dairy cows. They stand the drought better than corn. Sorghums can be used for soiling, pasturage, hay and ensilage, making one of the best and cheapest cattle feeds for the feed-fattening trade after it begins to head out. For soiling the cutting may profitably begin as soon as the heads are formed. It is usually cut for ensilage when the seed is in the dough stage. The seed may be planted at various times to secure a succession of forage. When sown for forage crop the yield should average on good land from 5 to 10 tons per acre. Corn fodder may sometimes surpass sorghum in muscle-making, but sorghum is ahead in the fat-forming element. Sorghum is a heavier yielder than corn, and its roots go deeper into the ground to get food than corn roots would get. It is quite profitable to grow sorghum as a fattening food for cattle. The best varieties to sow for fodder purposes are the Amber and Orange. The Sugar Drip is the best to sow for syrup-making.

**WHITE NAVY BEANS** are one of the crops that should be liberally planted everywhere. At high prices at which these are selling, they should prove very profitable, and at the same time, they make one of the best crops to plant for use during the winter. Navy Beans are best planted in June or early in July.

Plant in rows three feet apart, dropping two to three beans together a foot apart in the rows. Cultivate early, as they grow rapidly, but do not work them while the dew is on them. Fertilize them and cultivate them deeply, but do not cultivate after they begin to bloom. Carefully grown, these will prove a profitable and successful crop. A peck will plant an acre.

**SOLD OUT OF SWEET POTATO PLANTS.**
LATE SEED POTATOES.
FOR JUNE AND JULY PLANTING.

While market or table potatoes are rather low in price now, the indications are that stocks will be well cleaned up before the time for late planting; and we believe that the prospects for growing a crop of potatoes this year are very good indeed. There has been a much less acreage of potatoes planted everywhere, as far as we can ascertain. Certainly throughout the South the planting of the early crop is very much less than usual, and we understand that planting in the North and West, particularly in the potato districts, will be nothing like as heavy as last year, due a good deal to the present low price of potatoes.

This would indicate that there will be a much smaller crop of potatoes harvested this year than last year, and should mean much better prices; and, if anything serious happens to affect the crop, will mean very high prices another year. We strongly recommend to our customers to make their usual plantings of late potatoes, not only for market, but also for home and private use. Book orders now so as to secure the varieties you desire. See next page for information.

PLANT FOR PROFITABLE CROPS

EARLY RAMSHORN BLACKEYE PEAS
AND THE EARLY VARIETIES OF
SOJA BEANS

ITO SAN, EARLY WILSON, BLACK and the EARLY GREEN VARIETIES.

All of these can be safely planted in June, and the indications are that these will make a good, profitable money crop for sale as market Beans and Peas another season. Indications are that nothing like as many Blackeye Peas are being planted this year as usual. This should make for good prices another year.

The early varieties of Soja Beans always sell considerably higher than other Soja Beans.

Farm Implements! Write to The Implement Co.
1302 E. Main Street, Richmond, Va.
For prices of your requirements in these lines.
BINDERS, MOWERS and HAY RAKES
Are especially seasonal at this time and we can offer these to special advantage.
We are also agents for the celebrated AVERY TRACTORS and MOTOR CULTIVATORS.
Write for circulars, prices and information.
When Sending Orders at Prices Named Here, Please Mention Crop Special No. 1027.

May 29, 1918.

The prices named below are our prices at this date. Prices of Field Seeds are always subject to market fluctuations. We always fill all orders entrusted to us at lowest ruling prices on date order is received. If prices decline, we give our customers the benefit of it. If they advance, we charge the advance prices. In case customers desire to limit us to filling orders at prices quoted on any particular date they will kindly so state on order, or mention date and number of "Wood's Crop Special" upon which the order is sent.

Terms on all Field Seeds, net cash. Customers who have no regular accounts with us will kindly remit the amount of their order or name business reference as customary before opening new accounts.

CRIMSON CLOVER

Cotton Bags Holding (2½ Bus.) Each 55c. Extra.

WOOD'S SEED CORN.

We can supply all the varieties of Seed Corn offered below of good tested germination. We are very careful in the testing and examination of Seed Corn sent out by us, and are supplying corn at this time of better germination than earlier in the season. There have been very large quantities of corn raised this year, which owing to difficulties in curing and maturing, proved deficient in germination, and we would advise our farmers everywhere to test corn of their own growing before planting. Corn, too, should be planted a little thicker than usual so as to overcome any deficiency in germination. It is very much better to do this rather than to fail to get good stands of corn.
